The new Photoshop is faster than the previous Lightroom and both of their preview modes are really speedily. Lightroom 5 is faster than Photoshop, but as mentioned, with the new interface on both sides, Lightroom now makes some really intelligent decisions. This means it works faster. This does, however, take away the magical right-click and auto-correct workflow that was designed into the original Lightroom. There's nothing inherently wrong with that, but a well laid out interface really benefits from auto-correct because you can see what an adjustment will do. Compression, RAW, and the new, broadbanded.AI files are typical, simple tweaks that give legacy users something to get used to. It mostly seems to be a streamlining of the interface and a tidying up of some of the locations where you can find things. The Google Cloud-based catalog makes everything more accessible. There are new and better ways of organizing the files and new ways to look at things, bringing some needed interactivity to the table. Unfortunately, there's not a lot that's added to the actual editing tools. While the new skills are there, Adobe is really not going to push them very hard. That's not just a disappointing blow on Lightroom's part, but also an indication of exactly how much has changed in the last three years. Photoshop's marketing department is still pushing the idea that it's a simple and straightforward tool: "Maybe a photo editor?", "Nope. Photoshop." if there were any more signs about the way things will be, that's it. Actually, there are: the new masking options and the new radial filters – both awesome additions to the photo editing experience. With the new masking options, users will have the ability to brush and fill a selection based on a structural mask. And the radial filters work just like they did before, but with some options that Photoshop did not previously have. All these new features are free.
